

◆ Total utility (top axis) Import Wind share Ownership
 Cost Land Gas share Other (biomass, coal, nuclear, transmission)

DE-CH

FR-CH

Segments show the deviation from the scenario mean per attribute, not the absolute contribution (mean over all 12 scenarios, per region).
 Their sum is $U - \text{mean}(U)$; the diamond marks this sum and is read as true total utility on the top axis. Scenarios sorted by national utility (highest at top).
 Absolute contributions incl. constant terms: see Fig. A1.
